

# LOGBOOK

DATE: Feb 10 - March 4

My Topic was “What liquid should you use if you want your Sunflower plant to grow faster in 2 weeks?”

I had four observations 1: As soon as i planted it

2: One week in.

3: Two weeks in.

4: Three weeks in.

CONCLUSION: At the start of the experiment, I thought that milk and water would help the sunflower seeds grow the most. However, after two weeks, only the seed watered with **plain water** grew. The seeds given milk, detergent water, vinegar, and Sprite did not grow. This shows that **water is the best liquid for sunflower seed growth**, and other liquids can stop or slow down plant growth.
